EWB VPC PEERING PROJECT

Secure Multi-VPC Network Connectivity on AWS

Student	Vikas Prajwal
Program / Batch	EWB AWS Internship – Batch 1
AWS Region	Asia Pacific (Sydney), ap-southeast-2
Report date	19 October 2026

Project objective

Create private network connectivity between two AWS VPCs through VPC Peering, configure subnet routes and security-group rules, and verify reachability with ICMP ping and bastion-host SSH tests.

Architecture

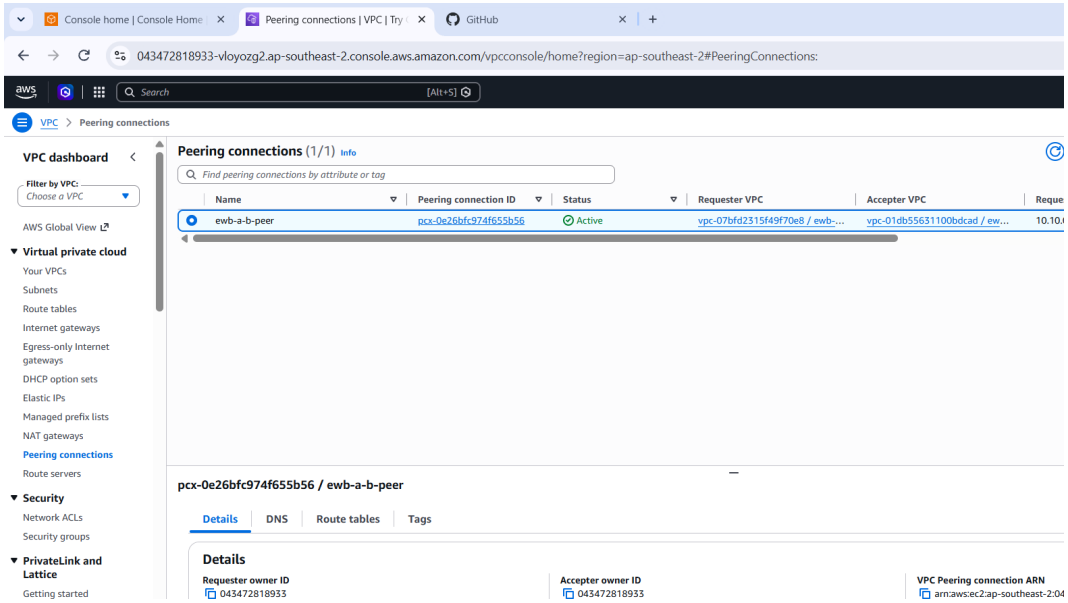

VPC A – ewb-vpc-a: 10.10.0.0/16; public subnet 10.10.1.0/24 (bastion 10.10.1.10); private subnet 10.10.2.0/24 (App-A 10.10.2.10).
VPC B – ewb-vpc-b: 10.20.0.0/16; private subnet 10.20.1.0/24 (App-B 10.20.1.10).
Peering: ewb-a-b-peer; requester 10.10.0.0/16, accepter 10.20.0.0/16.

Security note: This report does not include private keys, passwords, or access tokens.

1. Network Configuration Evidence

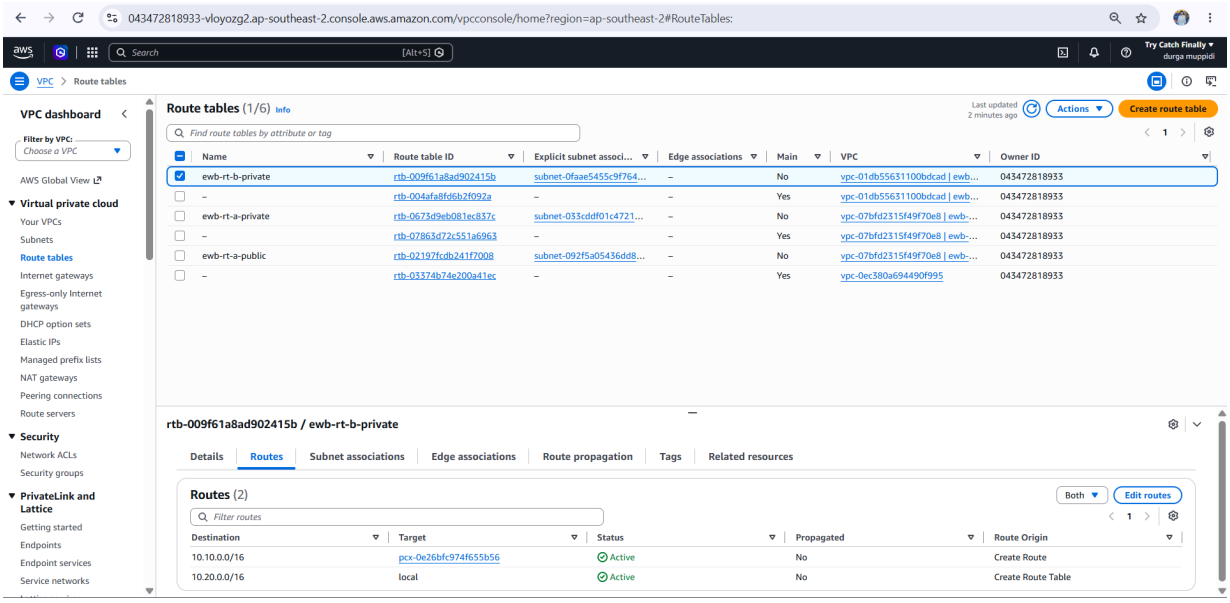

The following screenshots document the VPC/subnet inventory, route tables, active peering connection, and security-group configuration before cleanup.

VPC inventory

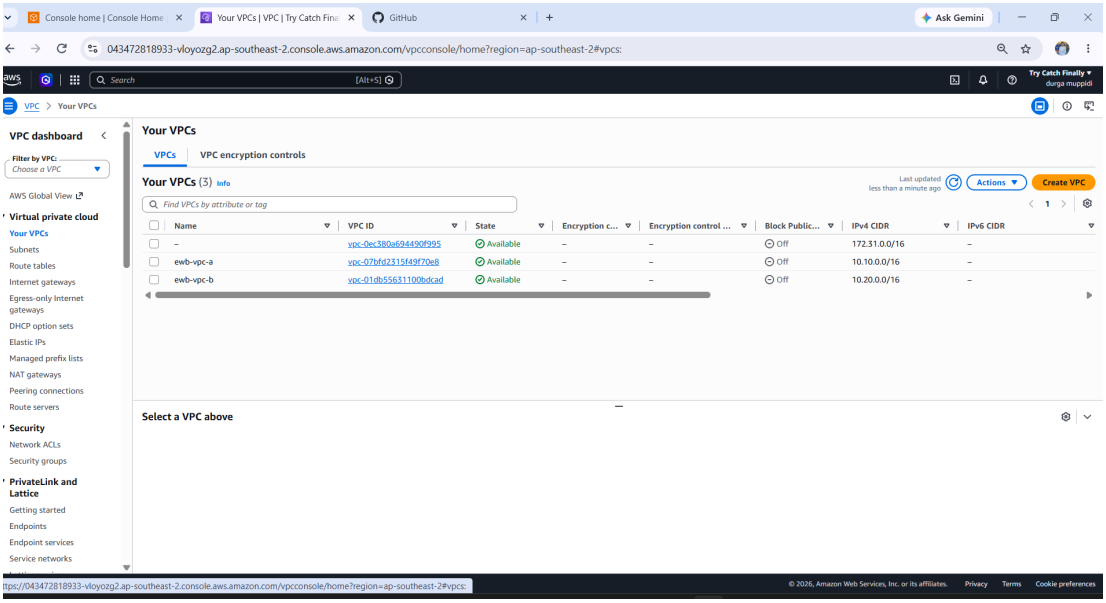

VPC A and VPC B were present with CIDRs 10.10.0.0/16 and 10.20.0.0/16.

Subnet inventory

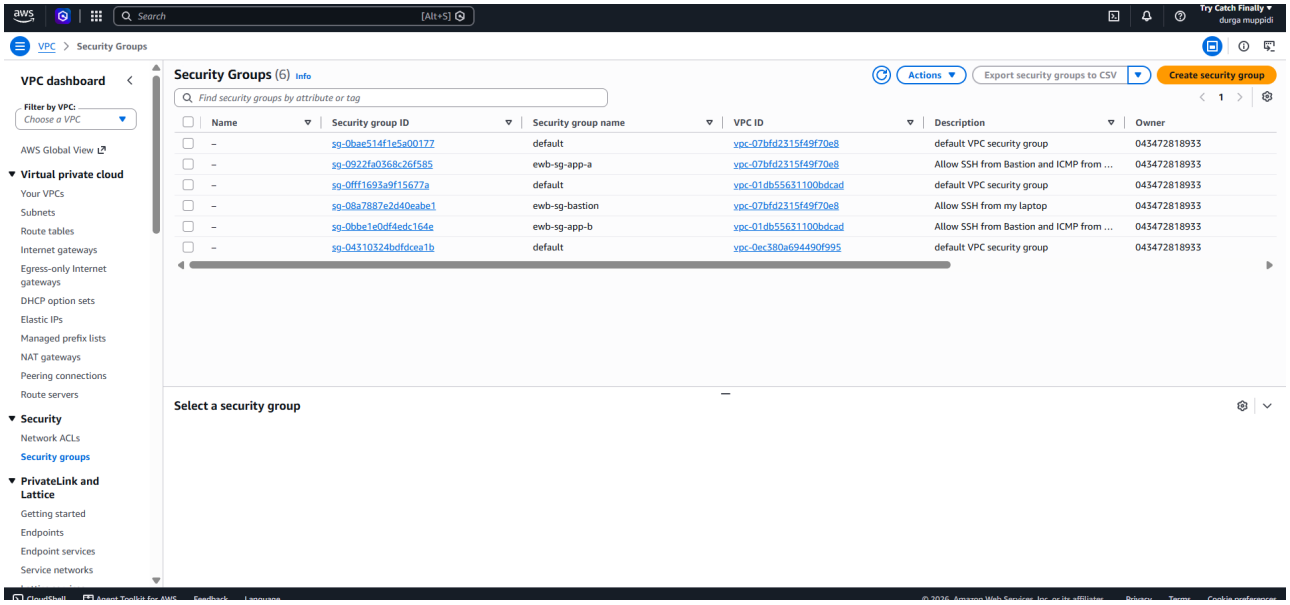

Project subnets include 10.10.1.0/24, 10.10.2.0/24, and 10.20.1.0/24.

Route table evidence

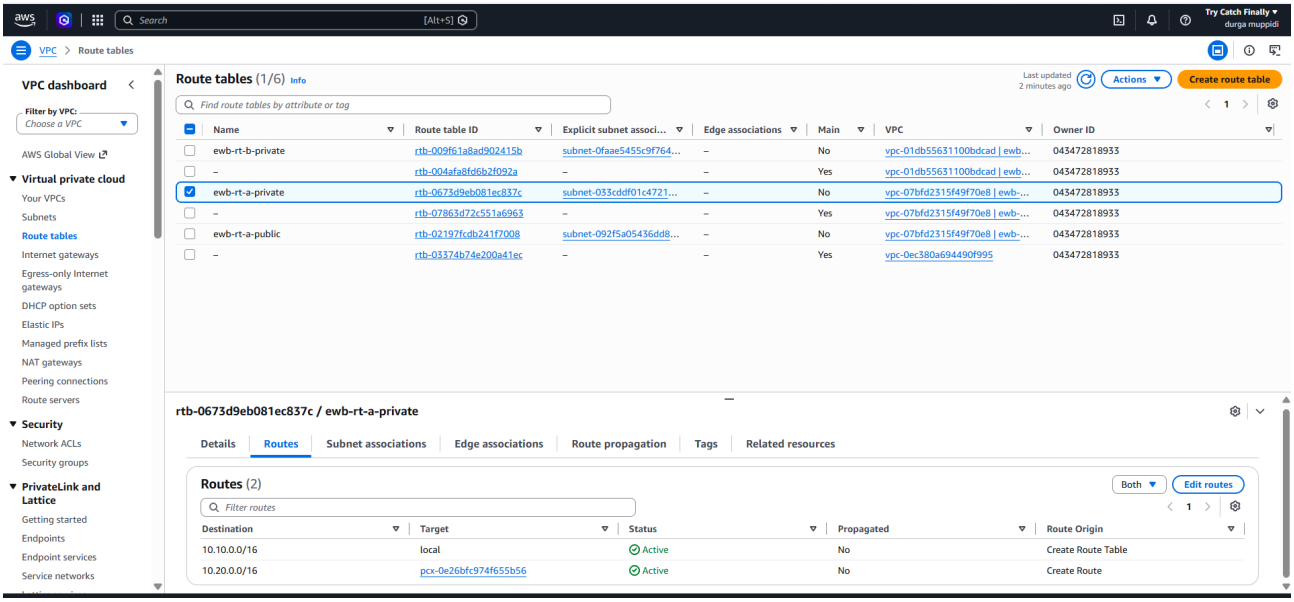

The route table screenshot shows the peering target for the opposite VPC CIDR.

Active VPC peering

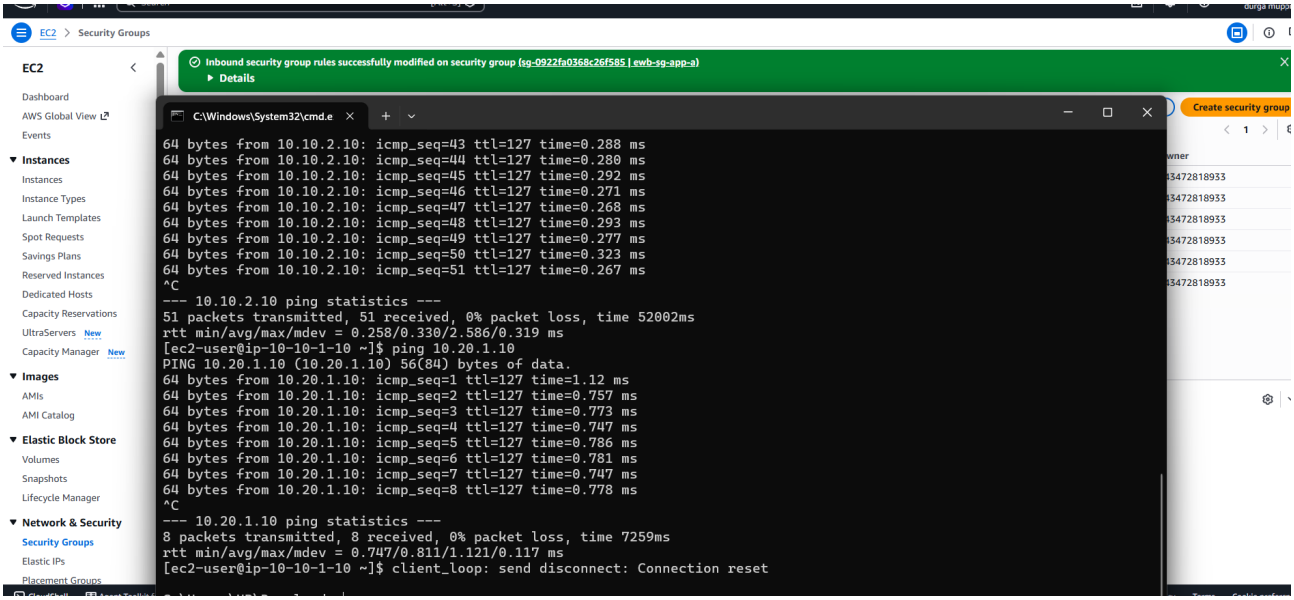

The ewb-a-b-peer connection was Active before cleanup.

Security-group rules

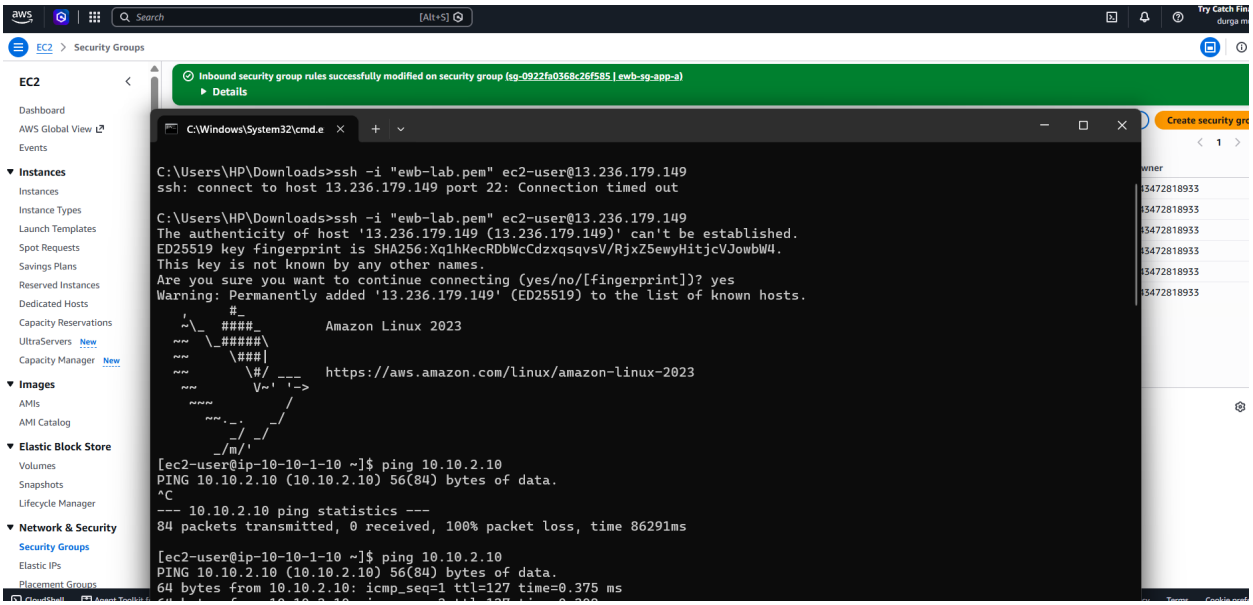

Inbound ICMP rules were configured for connectivity testing.

Ping test evidence

Terminal output shows successful replies from the tested private IPs.

SSH and terminal session

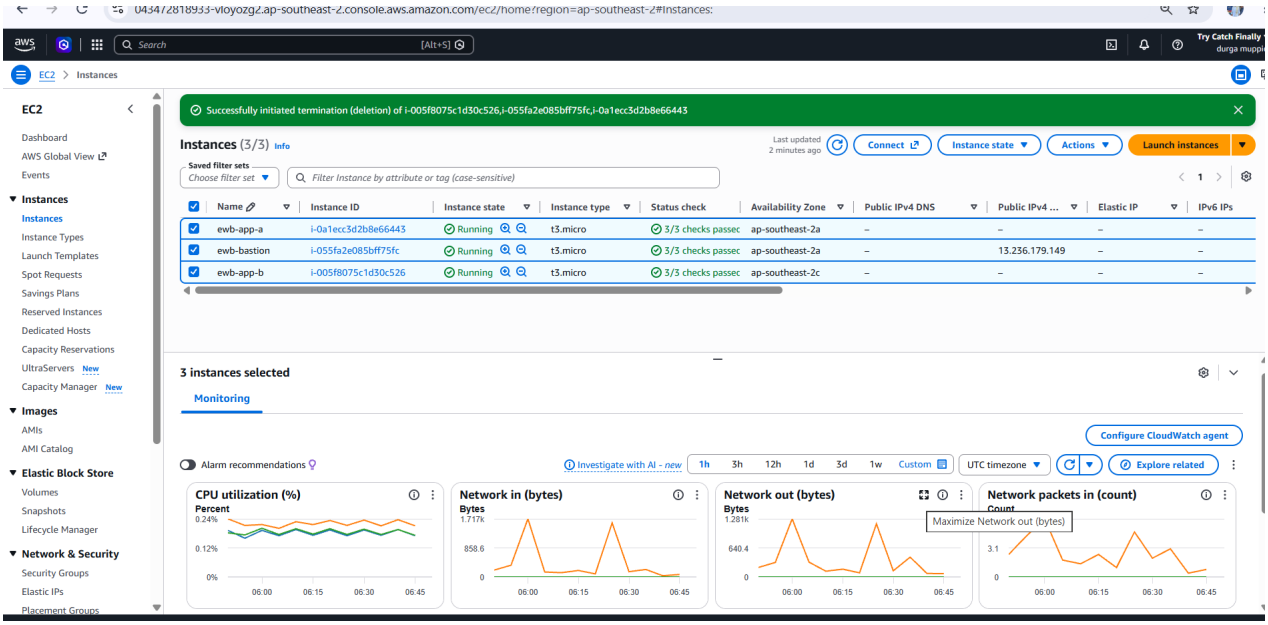

Terminal evidence for the bastion-host session and network checks.

2. Cleanup Evidence

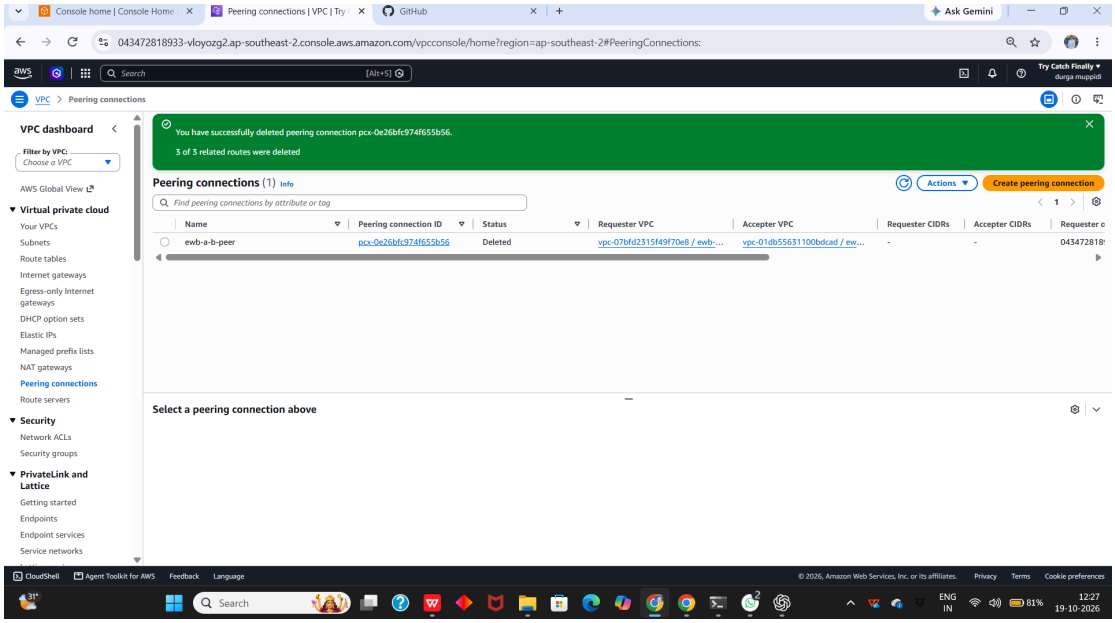

The following screenshots were captured during cleanup. They are included as evidence of the actions shown by the AWS console; where the console says an action was initiated or a confirmation dialog is open, this report does not claim more than the screenshot proves.

EC2 instance termination initiated

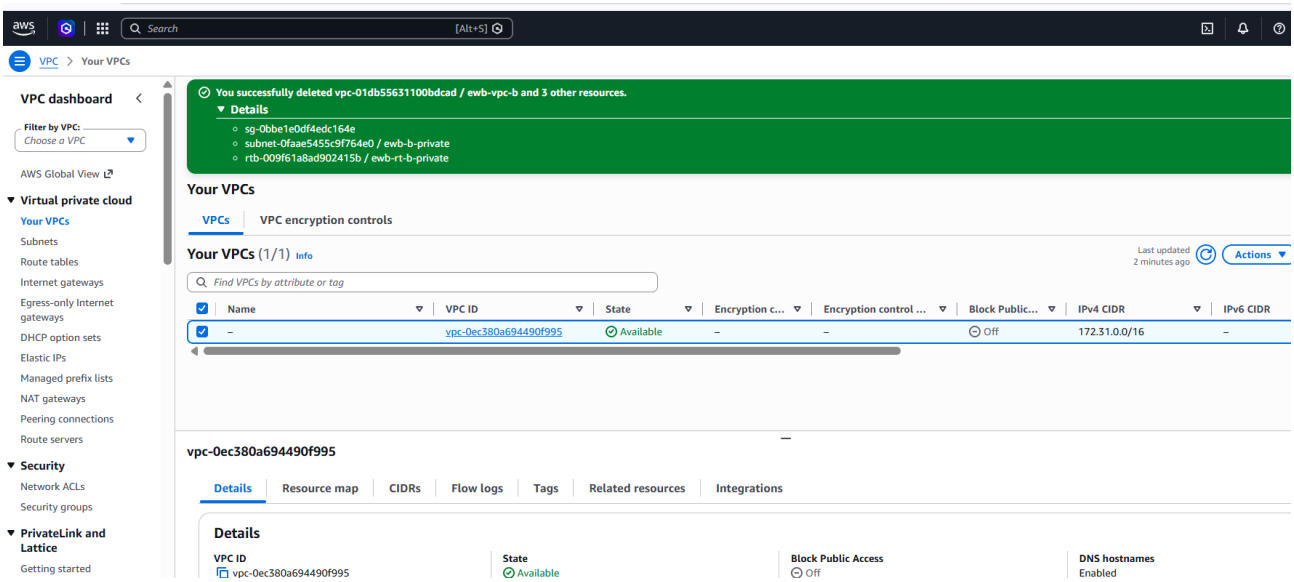

AWS displayed “Successfully initiated termination (deletion)” for the selected three instances. This screenshot proves termination was initiated, not by itself that every instance reached the terminated state.

VPC peering connection deleted

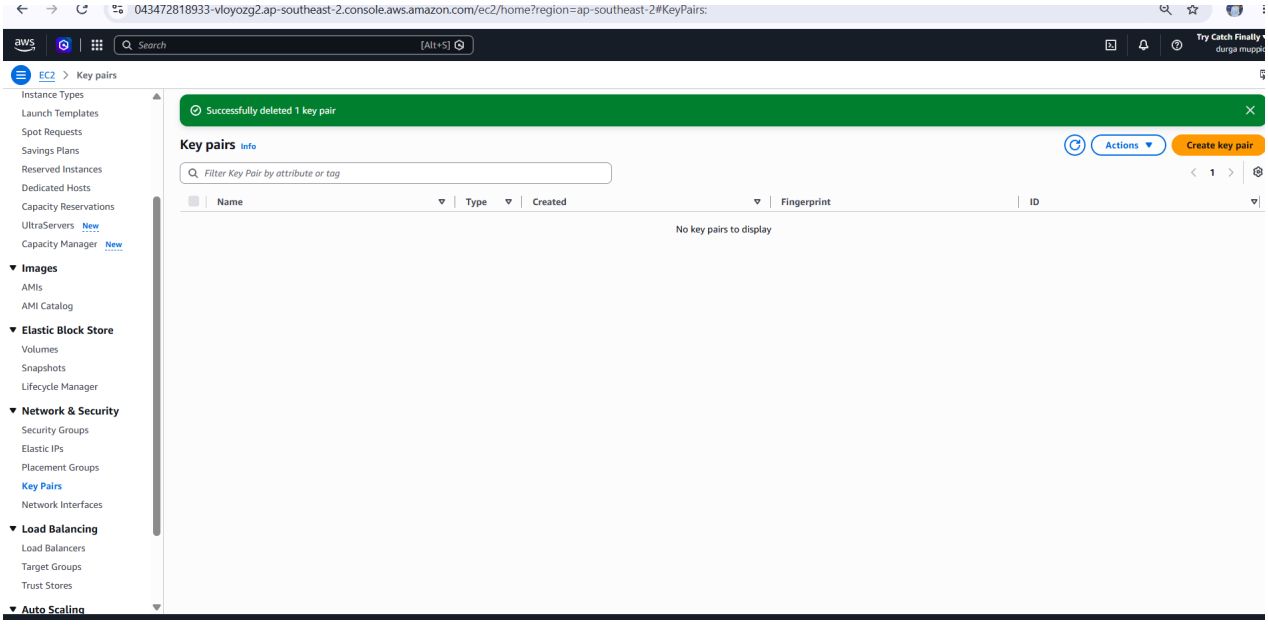

AWS confirmed successful deletion of peering connection pcx-0e26bfc974f655b56 and reported that 3 related routes were deleted.

VPC B and related resources deleted

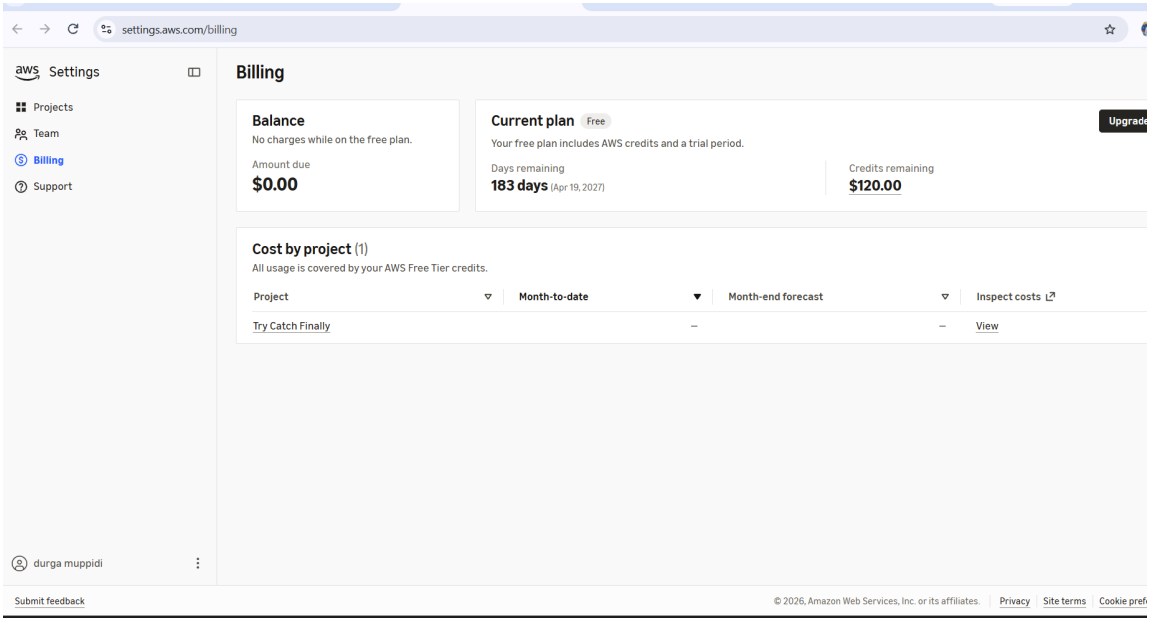

AWS confirmed deletion of VPC B (vpc-01db55631100bdcad) and 3 related resources.

EC2 key pair deleted

AWS confirmed successful deletion of 1 key pair; the key-pair list then showed no key pairs to display.

Billing / Free plan check

The AWS billing screen showed Free plan, $0.00 amount due, and $120.00 credits remaining at the time of capture.

3. Test Results, Limitations & Submission Checklist

Connectivity: Successful ping replies are visible for 10.10.2.10 and 10.20.1.10 in the terminal evidence. Ensure the final submitted report explicitly labels source host, destination, forward/reverse direction, and App-B SSH proof if those are separate checklist requirements.

Controlled ICMP failure and recovery: The available evidence includes successful connectivity and a security-group update. Add a dedicated screenshot of the failed ping and a second screenshot of recovery if your instructor requires both states as proof.

Cleanup caution: Screenshots show VPC B, peering, and a key pair deletion, plus EC2 termination initiated. The available evidence does not clearly prove that VPC A was successfully deleted or that all EC2 instances reached the final terminated state. Verify the console if you need to claim complete cleanup.

Submission checklist

Requirement	Evidence / remaining action
Cover, name, batch, title, region, date	Included
Architecture, VPCs, subnet CIDRs, route tables	Screenshots included; verify route-table associations are all legible
Active peering and security-group inbound rules	Included
Ping results and App-B SSH proof	Ping evidence included; ensure reverse ping and App-B SSH proof are explicit
Controlled ICMP failure and recovery	Add separate failed-ping and recovered-ping screenshots if required
Cleanup evidence	Added: termination initiated, peering deleted, VPC B deleted, key pair deleted, billing check
Cleanup fully completed	Not fully verified by the available screenshots; check remaining VPC A and instance states before claiming complete cleanup

This revised report includes cleanup evidence screenshots found in the provided files. Please review the checklist before final submission.
